

THE REEF ATLAS BUILT ON SCIENCE

Every reef has a season. Find yours.

Live reef health and species encounter odds for every dive site, powered by NOAA Coral Reef Watch and 63 ocean data sources.

Divers spend thousands on a trip with no reliable way to know a reef's current condition.

- The science exists, but it lives in NOAA feeds, survey databases, and journal papers the diving community never sees.
- Operator marketing fills the gap with outdated or biased claims.
- 6 to 7 million divers make booking and in water decisions every year, effectively blind.

A live web atlas for every dive site.

We fuse NOAA Coral Reef Watch satellite data with in water surveys to label each reef, and we calculate species encounter probability from real diver logs.

IMPROVING

STABLE

DECLINING

We translate ocean science into something a diver can read and act on before they get in the water.

Three things no other dive platform does.

01

Live reef health

What the reef looks like today, not what last year's dive guide said. Live NOAA satellite data plus the most recent in water coral surveys.

02

Encounter odds

How likely you are to actually see each species, scored Rare to Almost always from real diver observation records.

03

One upload, 5 platforms

Upload a sighting once and we send it to iNaturalist, GBIF, OBIS and more. 38 minutes of data entry becomes 3 seconds.

Shipped and in production. This is not a concept.

Real divers use it now at scubaseason.fun.

384

LOCATIONS

63

DATA SOURCES

Live

NOAA STRESS PER SITE

3s

TO 5 DATABASES

NOAA needs ocean data to reach beyond research institutions, and to gather more observations. We do both.

- We distribute NOAA Coral Reef Watch data and 62 other sources to millions of motivated divers in plain language.
- We turn those divers into a distributed sensor network, forwarding their sightings to iNaturalist, GBIF, and OBIS automatically.
- We both consume Ocean Enterprise data and generate new observations for it, and we ingest every new NOAA dataset as it publishes.

6–7M

ACTIVE CERTIFIED DIVERS

\$11B

ANNUAL DIVE TRAVEL SPEND

Scuba Season is free for divers today. Our first community is the engaged audience already drawn to us, the divers who care about reef state and species encounter probability and want to give back, and we make contributing effortless through a single upload that reaches 5 conservation databases.

Connecting two sides that rarely meet.

Conservation organizations and research institutes spend heavily sending teams on expeditions to monitor reefs. Yet millions of divers are already in that same water every day.

We are building the structured layer between them, so organizations can commission monitoring and pay divers for verified observations instead of funding costly expeditions.

DIVE REVIEW SITES

Diviac, DiveBuddy, TripAdvisor. User reviews, no live science, cannot tell you if a reef is improving or declining.

CONSERVATION DASHBOARDS

GCRMN, Allen Coral Atlas, NOAA Coral Reef Watch. Rigorous, but built for researchers, no connection to trip planning or encounter odds.

The only platform between the two.

- The only live reef health rating, not static guidebook text.
- The only species encounter probability scored from real diver logs.
- The only one upload to 5 databases flow.

The team to build it.

JOSIE LEUNG · FOUNDER

Leads product, reef health data sourcing, platform, and partnerships. Built the data pipeline across 63 sources including NOAA Coral Reef Watch, Global Fishing Watch, iNaturalist, and GBIF.

JOON WHANG · CO-FOUNDER AND CTO

Full stack engineer, 5+ years building consumer products and developer infrastructure. Previously Co-Founder and CTO at MilkyWay and Lead Frontend Engineer at Ignite, formerly Tendermint.

Three things, and we are specific about each.

01 · Scripps

Methodology

Scripps Institution of Oceanography to stress test our reef state and species encounter methodology with world class reef scientists.

02 · Rady

Business model

Rady School mentorship to structure the paid monitoring marketplace and our grant strategy beyond this application.

03 · NOAA

Network

The NOAA Ocean Enterprise network for the data partnerships that make Scuba Season meaningfully stronger.
